## Heuristic Evaluation

Bugs that I found:

### 1. Simplifying navigation

Before, I included 2 ways to get to the navigation page – clicking the shop and also scrolling down to the shop page. I chose to simplify this by making the shop page separate rather than making the website one long continuous scroll to improve the utility of the navigation bar at the top.

### 2. Presenting options

Before, I would present options in 2 different ways on the product selection page – vertical options for the glazes and horizontal options for the quantity. I standardized this by making both options horizontal.

### 3. Consistent header

Before, the header on the front page was in a different place and was a different size than the other 2 pages. I updated the front page header to be the same style and size as the header of the other 2 pages.

One challenge I had was being able to place things next to each other on the page. I wasn't able to figure this out until I used a grid to create an underlying structure to the page. From there, I was able to add elements side by side to mimic the original design of my prototypes.

Another challenge that I faced was centering elements of the grid. As I would try to center the text in the boxes of the grid as well as the overall grid itself, I found that my code would only achieve one of those 2 things at once, no matter what combination I attempted. I solved this by instead adding a margin for the grid to help center it, and then centering the individual items in the grids by adding code to center items in the CSS file.

I chose to go for a minimalist design to promote a simplified experience for a shopper. By using tones of blue and gray, I hope to convey a soothing environment for the user as they navigate through the page. By using few colors and colors designed to evoke a sense of comfort in the user, this website is able to invite the user to easily purchase a comfort food such as cinnamon rolls in an easy and simplified fashion.
